FOR IMMEDIATE RELEASE

R-V INDUSTRIES, INC. PROVIDES PRESS SECTION REBUILD FOR ROCK-TENN COMPANY'S PAPER MACHINE IN BATTLE CREEK, MICHIGAN.

HONEY BROOK, PA , FEBRUARY 21, 2008

In an effort to upgrade the performance of their paper machine in Battle Creek, MI, **Rock-Tenn Company** contracted **R-V Industries, Inc.** of Honey Brook, PA. R-V and Rock-Tenn's project team's collaborated to establish an optimal design for the rebuild of their Press Section.

The features of this project included upgrading to a modern highly loaded press along with reconfiguring the cluster press, which resulted in the reduction of moisture content entering the dryer section. In an effort to inhibit the effects of corrosion, heavy gauge stainless steel was used to manufacture the entire press.

R-V incorporated their patented TL Roll design on all felt rolls and manufactured all guides, stretchers, doctors and the save-all system. R-V also manufactured the large diameter, highly loaded press rolls and operational spares. Operator access and safety was greatly enhanced with the use an extensive walkway system. A unique roll out beam system for use with the large diameter press rolls, makes for easier roll removal.

The press section was installed and commissioned during the fall of 2007. With the addition of the new press section, the paper machine has surpassed previous record production levels.

R-V Industries has been designing and building reliable and innovative equipment for the Pulp & Paper industry for over 50 years. The success of this project can be attributed to the customer focus of R-V Industries and the forward looking vision of the Rock-Tenn Company, combined with the strong communication between the two companies.
