Our Suction Roll Overhaul Program includes:

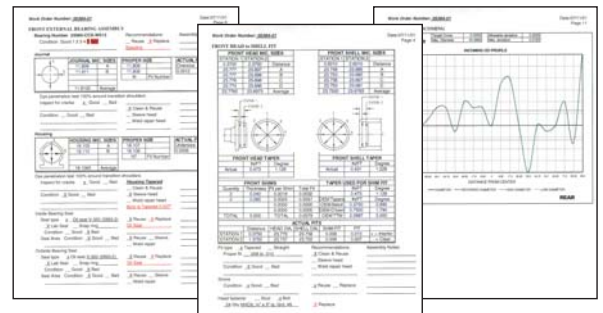

Trucking: A fleet of trucks are available to service our customers.

Disassembly & Inspection: Once the roll has been disassembled, inspectors mic and record critical sizes on all components.

Recommendations: Our engineering department reviews the inspection report and prepares a list of recommendations. Customers are welcome to review the recommendations and inspect the roll at our facility. Our sales department then submits an itemized quotation for the repairs.

Repairs: Upon customer approval, engineering prepares drawings and manufacturing completes the repairs.

Assembly & Quality Control: The roll is reassembled with new parts and quality is ensured by our detailed inspections throughout reassembly.

We utilize an extensive inspection report to ensure every critical component is inspected and documented. This report details the methods used for the repairs of each roll.
